FLOWFILL PANEL GROUT

GENERAL PURPOSE NON-SHRINK CEMENTITIOUS GROUT

14 November 2017

YOUR SMART ADVANTAGES

- Pre-hardening volume-adjusting. Controlled gaseous expansion system compensates for shrinkage and settlement before hardening occurs
- Ready to use, pre mixed, requires only the addition of water
- Enhanced working life
- No metallic iron content to cause staining
- Lower water/cement ratio reduces drying shrinkage, increases durability and reduces permeability
- Can be mixed for stiff, plastic, flowable or fluid application

DESCRIPTION

General purpose non-shrink (Class A) cementitious grout with enhanced working life, ideal for pre-cast and tilt-panel work.

APPLICATION

Application thickness 20mm-120mm

USES

PRODUCT CHARACTERISTICS

APPLICATION INSTRUCTIONS

Substrate and Surface Application
The substrate surface must be clean, sound and free from oil, grease, curing compound or any loose materials. It must be mechanically abraded back to a sound concrete.
- Bolts or anchor holes must be clean and free from dust or loose material. This can be achieved by clean the hole.
- Base plates must be cleared of all rust, oil or grease. It is essential to provide air pressure relief holes for venting.

Pre-Soaking
It is essential to pre-soak the concrete substrate prior to application of Bostik Flowfill Panel Grout. Pre-soak substrate with water for a minimum of 6 hours prior to grouting. Immediately before pouring the excess water should be removed, all water in the anchor and bolt holes must be blown out and no traces of free water present whilst grouting.

Formwork
Formwork must be constructed to facilitate rapid and continuous filling, whilst remaining leak proof and water tight. Foam rubber strips or suitable sealants undertaken the formwork are recommended.

Unrestrained Surface
As Bostik Flowfill Panel Grout is an expanding grout, it is advisable not to have any unrestrained areas.

Low Temperature Working
At temperatures below 5°C the cure rate and strength development rate will be dramatically reduced. If early strength is required, it is advisable to use heated water and condition Bostik Panel Grout to 25°C. Do not exceed this temperature.
High Temperature Working
At temperatures above 30°C, it is advisable to use water below 20°C when mixing grout. All materials must be kept cool and away from direct sunlight. If practical, the installation area should be shaded by erecting shade screens. If ambient temperatures are excessive, grouting should be scheduled for early morning or late afternoon.

Mixing
Bostik Flowfill Panel Grout requires between 3 - 4.4 litres of potable water per 20kg bag, depending on the desired consistency. For optimum results, use a cage or impeller style mixing stirrer powered by a heavy-duty electric mixing drill. Care is to be taken while mixing to avoid the formation of air bubbles.
- Add pre-measured water to a clean mixing bucket.
- Gradually add powder into the water whilst continuously mixing the contents of the bucket. When the entire contents of the bags have been added to the water, mix for a further 3 - 5 minutes to achieve maximum results. Mix product must be smooth, lump free and homogenous consistency.

It is essential that the grouting operation is continuous hence ensure sufficient labour and mixing capacity is available.

* Consistency is in accordance to ASTM C1107/C1107-11 and AS 1478.2-2005 Table 4.1.2.2

CAUTION
DO NOT MIX BY HAND
DO NOT ADD ADDITIONAL WATER
Discard any unused grout that has stiffened or hardened. DO NOT RETEMPER

Pouring
The desired ambient temperature for pouring is approximately 20°C. At this temperature it is essential the grout is placed within 25 minutes of mixing as this will ensure the expansion process is maximised. Ensure the entire area to be grouted is completely filled. We advise the following:
- Use a suitable head box to ensure continuous flow of grout.
- Place/ pour grout from one side, minimizing the likelihood of trapped air.
- The grout head must be maintained at all times so that a continuous grout front is achieved.
- Do not use mechanical vibrators to assist in flow as this will cause segregation of aggregate.

Curing
On completion of grouting the exposed area should be covered with wet hessian, plastic sheeting or Bostik Bond ‘N’ Cure to prevent excessive moisture loss. At ambient temperature, formwork should be removed no sooner than 24 hours after completion of grouting. The covering should stay in place for a further 6 days. Lack of sufficient curing could result in plastic cracking and drying shrinkage on the surface.

BOSTIK CO OPERATIVE TEST PROGRAM
Bostik offer a service in which a program has been established to eliminate potential field problems by pretesting Bostik adhesives with samples of building materials to which the adhesive will be applied. This service is available on large projects where pre application testing will aid in determining the proper surface preparation method to achieve optimum adhesion. Consult a Bostik representative for further information.

Fresh Wet Density
Approx 2100 Kg/m³ depending on actual consistency used

Bags Per Cubic Metre
85 – 90 bags depending on actual consistency used

Pack Size
20kg

STORAGE & SHELF LIFE
Flowfill Panel Grout GP has a shelf life of approximately 12 months in unopened bag. Must be stored in a cool, dry elevated place and protected from high humidity.

SAFETY PRECAUTIONS
SEE THE MATERIAL SAFETY DATA SHEET FOR ADDITIONAL INFORMATION.
EMERGENCY INFORMATION: 1800 033 111 (ALL HOURS)
MSDS can be downloaded from www.bostik.com.au

CLEAN-UP
Flowfill Panel Grout should be removed from tools and equipment with clean water immediately after use.

VOC – 0 g/Lt
